

THE GRAY LINE

By Technical Systems

*I.T. folks are smart. When your customer is the expert in data management systems and data analytic solutions...you better offer them an intelligent solution. With TSI's Gray Line Fluid Cooler and Integrated Pump Package, you get the lowest installed cost coupled with optimal operating costs to provide an innovative solution to a common data storage requirement. Plus, it saves energy and everyone knows it is smart to **Go Green!***

The Problem: Not Getting the Most "Free Cooling"

Data centers require 24/7/365 cooling that is efficient, quiet, and keeps maintenance costs low. All these requirements must be accomplished with the lowest installed cost possible. With so many demands, many people settle for a system that does not meet all these requirements.

The Solution: TSI's Gray Line Fluid Cooler

The TSI Gray line solution uses large capacity fluid coolers with an integrated pump package that arrives at the site ready for utility hook up. Our approach, versus the use of multiple smaller units, reduces the number of units, installation, power wiring and maintenance.

- You get the fewest number of units.
- It takes the least amount of time to install and place into operation.
- Provides inherent redundancy by using multiple coils and fans in a common footprint.
- You get dual pumps with one pump dedicated to standby in the event of a pump failure.
- Quick install with a single point power connection (*won't get that with multiple units!*)
- Simple is Smart: Comes with a very short list of maintenance points and recommended spare parts.
